Introduction

This Air Quality and Greenhouse Gas Analysis identifies and analyzes the potential environmental impacts from the Northwest Rocklin Area General Development Plan Project (proposed project) related to air quality and greenhouse gas (GHG) emissions. The information and analysis in this document is organized in accordance with the checklist in Appendix G of the California Environmental Quality Act (CEQA) Guidelines. If the analysis provided in this document identifies potentially significant environmental effects of the project, mitigation measures that should be applied to the project are prescribed. All modeling results are included as an attachment to this document.

Project Summary

The proposed project area, also known as the Highway 65 Corridor Planning Area consists of development areas 104-116 of the Northwest Rocklin General Development Plan area, in the City of Rocklin, California. The project area is bound by State Route 65 on the west, Wildcat Boulevard to the east, the Rocklin City Limits to the North and Sunset Boulevard to the South.

In 2002 the City of Rocklin, granted a maximum daily trip cap of 77,043 trips for the Northwest Rocklin area (NWRA), which was the level of traffic expected to maintain acceptable operations of the City's roadway system. The City of Rocklin now recognizes the marketing and economic disadvantages of limiting the development potential of NWRA properties and has initiated the process of redesignating land uses to reduce the amount of land designated for industrial uses and increase the amount of land designated for retail and residential use.

Fehr and Peers has conducted a Transportation Impact Analysis for the proposed land use changes using the updated City-wide traffic model. The Transportation Impact Analysis proposed a new trip cap of 98,010 trips, which represents an increase of 20,967 trips from the original cap. Fehr and Peers also provided an estimate of the vehicle miles travelled that would result from the estimated increase in daily trips.

Because the number of vehicle trips and related vehicle miles travelled would increase as a result of the proposed project, and vehicle emissions are a large source of air pollutants and greenhouse gas emissions, the proposed increase in allowable trips is herein analyzed for potential impacts related to Air Quality and Greenhouse Gas emissions.

Discussion

- a-c. The proposed project area is located within the Sacramento Valley Air Basin (SVAB) and is under the jurisdiction of the Placer County Air Pollution Control District (PCAPCD). The SVAB is designated nonattainment for the federal particulate matter 2.5 microns in diameter (PM_{2.5}) and the State particulate matter 10 microns in diameter (PM₁₀) standards, as well as for both the federal and State ozone standards. The federal Clean Air Act requires areas designated as federal nonattainment to prepare an air quality control plan referred to as the State Implementation Plan (SIP). The SIP contains the strategies and control measures for states to use to attain the national ambient air quality standards (NAAQS). The SIP is periodically modified to reflect the latest emissions inventories, planning documents, rules, and regulations of air basins as reported by the agencies with jurisdiction over them. In compliance with regulations, the PCAPCD periodically prepares and updates air quality plans that provide emission reduction strategies to achieve attainment of the NAAQS, including control strategies to reduce air pollutant emissions via regulations, incentive programs, public education, and partnerships with other agencies.

The current applicable air quality plan for the proposed project area is the *Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan* (Ozone Attainment Plan), adopted September 26, 2013. The U.S. Environmental Protection Agency (USEPA) determined the Plan to be adequate and made such findings effective August 25, 2014. On January 9, 2015, the USEPA approved the 2013 Ozone Attainment Plan.

The 2013 Ozone Attainment Plan demonstrates how existing and new control strategies would provide the necessary future emission reductions to meet the CAA requirements, including the NAAQS. It should be noted that in addition to strengthening the 8-hour ozone NAAQS, the USEPA also strengthened the secondary 8-hour ozone NAAQS, making the

secondary standard identical to the primary standard. The SVAB remains classified as a severe nonattainment area with an attainment deadline of 2027. On October 26, 2015 the USEPA released a final implementation rule for the revised NAAQS for ozone to address the requirements for reasonable further progress, modeling and attainment demonstrations, and reasonably available control measures (RACM) and reasonably available control technology (RACT). With the publication of the new NAAQS ozone rules, areas in nonattainment must update their ozone attainment plans and submit new plans by 2020/2021.

General conformity requirements of the regional air quality plan include whether a project would cause or contribute to new violations of any NAAQS, increase the frequency or severity of an existing violation of any NAAQS, or delay timely attainment of any NAAQS. In order to evaluate ozone and other criteria air pollutant emissions and support attainment goals for those pollutants that the area is designated nonattainment, the PCAPCD has recently proposed updates to the District's recommended significance thresholds for emissions of PM₁₀, and ozone precursors – reactive organic gases (ROG) and oxides of nitrogen (NO_x).

The significance thresholds, expressed in pounds per day (lbs/day), listed in Table 1 are the PCAPCD's updated recommended thresholds of significance for use in the evaluation of air quality impacts associated with proposed development projects. The City of Rocklin, as lead agency, utilizes the PCAPCD's recommended thresholds of significance for CEQA evaluation purposes. Thus, if a project's emissions exceed the pollutant thresholds presented in Table 1, the project could have a significant effect on air quality, the attainment of federal and State AAQS, and could conflict with or obstruct implementation of the applicable air quality plan.

| Table 1 PCAPCD Thresholds of Significance | | |
|--|------------------------------------|---|
| Pollutant | Operational Threshold (lbs/day) | Cumulative Operational Threshold (lbs/day) |
| ROG | 55 | 55 |
| NO _x | 55 | 55 |
| PM ₁₀ | 82 | 82 |

Source: Placer County Air Pollution Control District. CEQA Thresholds. Accessible at <http://www.placer.ca.gov/departments/air/landuseceqa/cegathresholds>. Accessed September 2016.

Through the combustion of fossil fuels, motor vehicle use produces significant amounts of pollution. In fact, the PCAPCD cites motor vehicles as a primary source of pollution for residential, commercial, and industrial development.¹ Because motor vehicles emit air quality pollutants during their operations, changing the amount of motor vehicle operations in an area would change the amount of air pollutants being emitted in that area.

Implementation of the proposed project would involve changes to the allowable amount of vehicle trips to and from the project area. Originally, the Northwest Rocklin General

¹ Placer County Air Pollution Control District. *CEQA Air Quality Handbook*. October 11, 2012.

Development Plan included a maximum daily trip cap of 77,043 trips; the *Transportation Impact Analysis*, prepared by Fehr and Peers for the proposed project, determined that land use changes would result in a daily trip increase of 20,967 for a total of 98,010 daily trips.² Because mobile source pollutant emissions are directly proportional to vehicle usage, the proposed project would increase the amount of mobile source air pollution generated in the project area, as compared to what was originally anticipated for the Northwest Rocklin Area.

Mobile Emissions Estimation

In order to determine the change in air pollutant emissions that would result from approval of the proposed project, mobile emissions were estimated using the California Emissions Estimator Model (CalEEMod) – a statewide model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify air quality emissions, including GHG emissions. PCAPCD recommends using the most up-to-date version of CalEEMod and as such version 2016.3.1 of the software was used.³ The model applies inherent default values for various land uses, including vehicle mix, trip length, average speed, etc. However, where project-specific data was available, such data was input into the model (e.g., information from the *Transportation Impact Analysis* conducted by Fehr and Peers). Two distinct scenarios were modelled for emissions analysis (see the Appendix for the CalEEMod outputs for both scenarios).

Baseline Modeling Scenario

The first scenario represented operation of the project area under baseline build-out assumptions for the current area daily trip cap. In addition to the application of Fehr and Peers provided average daily trip rates, the baseline build-out modeling scenario assumed build-out of the project area would result in the construction of:

- 1,373,000 square feet (sf) of General Office buildings;
- 1,038,000 sf of Retail buildings;
- 810,000 sf of General Light Industrial buildings; and
- Capacity for 1,200 University students.

Because the baseline scenario represents build-out of the area under currently approved land use designations, the baseline scenario represents a reference point for mobile emission generation in the area. Once established, baseline emissions related to the currently approved daily trip cap may subsequently be compared to estimated emissions that would result due to proposed changes to the daily trip cap. Therefore, a second scenario was modelled using the proposed changes to the daily trip cap.

² Fehr and Peer. *Final Transportation Impact Analysis for the Northwest Rocklin Area General Development Plan*. May 05, 2016.

³ Placer County Air Pollution Control District. *CEQA Air Quality Handbook [pg. 4-2]*. October 11, 2012.

Proposed Project Modeling Scenario

The proposed project scenario assumed that build-out of the project area could result in the construction of:

- 1,390,000 sf of General Office buildings;
- 1,482,000 sf Retail buildings;
- 91,000 sf of General Light Industrial buildings;
- 370 Single Family dwelling units;
- 417 Multi-Family dwelling units; and
- Capacity for 3,300 University students.

In addition to the above land use changes, information from the *Transportation Impact Analysis* was also included in the proposed project modeling scenario. Such information included the estimated daily trip rates used for each type of land use, as well as the increase in the daily trip cap of 20,967 daily trips per day throughout the project area. Fehr and Peers also provided an estimated average trip length for trips within the City of six miles per trip. Therefore, an increase of 20,967 daily trips, where each trip would have an average distance of six-miles, would result in an estimated increase of 125,802 vehicle miles travelled (VMT) per day (i.e. 20,967 daily trips x six miles per trip).⁴ Estimated VMT is important for air quality analysis because the increase in VMT represents the actual increase in the amount of distance travelled in motor vehicles and thus the amount of additional air pollutants emitted. As such, trip lengths in CalEEMod were adjusted to achieve a VMT comparable to the VMT estimated by Fehr and Peers.

By modeling future emissions based on the currently approved daily trip cap for the area as well as modeling potential emissions that would result from the increase in VMT due to the proposed project, the estimated increase in emissions associated with the proposed project can be determined and compared to PCAPCD's operational and cumulative operational emissions thresholds presented in Table 1 above.

Mobile Emissions Comparisons

The estimated operational emissions from mobile sources for the baseline and proposed project scenarios are presented and compared below in Table 2.

| Table 2 UnMitigated Operational Mobile Emissions (lbs/day) | | | | |
|---|--------------------|----------------------------|------------|-----------|
| | Baseline Emissions | Proposed Project Emissions | Difference | Threshold |
| ROG | 163.52 | 211.07 | +47.55 | 55 |
| NOx | 265.73 | 342.33 | +76.6 | 55 |
| PM₁₀ | 311.23 | 396.04 | +84.81 | 82 |

Source: CalEEMod, October 2016 (See Appendix)

⁴ Fehr and Peers. *Technical Memorandum: Estimation of VMT for Northwest Rocklin GDP Land Use Changes*. October 12, 2016.

As shown in Table 2, the proposed project would result in an increase in mobile source emissions as compared to the baseline scenario. As discussed earlier, the increase in mobile source emissions would be due to the proposed increase in allowable daily trips in the area. To determine the significance of the estimated increase in mobile source emissions, the difference between baseline emissions and estimated emissions from the proposed project can be compared to PCAPCD's recently proposed thresholds of significance. Emissions of ROG would be anticipated to increase by 47.55 lbs/day with approval of the proposed project. However, such an increase would be below the 55 lbs/day threshold for ROG, and thus emissions of ROG from the proposed project would not substantially contribute to the PCAPCD's nonattainment status for ozone on an operational level.

However, the proposed project would result in an increase of NO_x and PM₁₀ emissions from baseline conditions in excess of PCAPCD's recently proposed thresholds. Therefore, the proposed project could result in a substantial contribution to the PCAPCD's nonattainment status for ozone and PM₁₀ on an operational level.

Cumulative Air Quality

Due to the dispersive nature and regional sourcing of air pollutants, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants, including ozone and PM, is a result of past and present development, and, thus, cumulative impacts related to these pollutants could be considered cumulatively significant.

The project is part of a pattern of urbanization occurring in the greater Sacramento ozone nonattainment area. The growth and combined vehicle usage, and business activity within the nonattainment area from the project, in combination with other past, present, and reasonably foreseeable projects within Rocklin and surrounding areas, could either delay attainment of the standards or require the adoption of additional controls on existing and future air pollution sources to offset emission increases. Thus, the project could cumulatively contribute to regional air quality health effects through emissions of criteria and mobile source air pollutants.

The PCAPCD recommends using the region's existing attainment plans as a basis for analysis of cumulative emissions. If a project would interfere with an adopted attainment plan, the project would inhibit the future attainment of AAQS, and thus result in a cumulative impact. As discussed above, the PCAPCD's recommended thresholds of significance for ozone precursors and PM₁₀ are based on attainment plans for the region. Thus, the PCAPCD concluded that if a project's ozone precursor and PM₁₀ emissions would be greater than the PCAPCD's cumulative-level thresholds, the project could be expected to conflict with relevant attainment plans, and could result in a cumulatively considerable contribution to a significant cumulative impact.

As shown in Table 2 above, the proposed project would result in an increase of ROG emissions that would be below the applicable cumulative-level threshold. However, the proposed project would result in increases of NO_x and PM₁₀ emissions that would exceed the applicable cumulative-level threshold.

Conclusion

While emissions or ROG would not be considered to contribute to the region's nonattainment status for ozone on an operational or cumulative level, the proposed project could contribute emissions of NO_x and PM₁₀ in excess of PCAPCD's operational and cumulative-level thresholds. Thus the proposed project would result in a ***potentially significant*** impact related to the emission of criteria pollutants for which PCAPCD is in non-attainment

Mitigation Measure(s)

The following mitigation measure would reduce emissions of NO_x and PM₁₀ below the applicable PCAPCD thresholds, and would also contribute to the reduction of Greenhouse Gas emissions, which are discussed further in the Greenhouse Gas section of this report. Consequently, the proposed project would result in a *less-than-significant* impact related to Air Quality.

III-1. In conjunction with submittal of a development application for any projects within the Northwest Rocklin Area that exceed the 2002 trip cap (as calculated using the trip generation rates provided in the May 2016 Final Transportation Impact Analysis for the Northwest Rocklin Area General Development Plan⁵), the applicant shall prepare and submit an Air Quality Emissions Estimate identifying the project's increase in estimated NO_x and PM₁₀ emissions from mobile sources as compared to those allowed under the 2002 trip cap. The estimated increase in mobile source emissions shall remain at or below 20.7 percent for NO_x and 17.7 percent for PM₁₀. If the emissions estimate identifies an increase beyond those identified above, the applicant shall submit an Air Quality Reduction Plan sufficient to reduce NO_x and/or PM₁₀ emissions to within the allowable emissions increases. The measures included in the Air Quality Reduction Plan would be anticipated to focus on the reduction of mobile source emissions by including project elements that encourage alternative modes of transportation, promote non-motorized transportation and result in the reduction of number of vehicle trips as well as vehicle trip lengths. The Air Quality Reduction Plan may also include payment of mitigation fees into the PCAPCD's Off-site Air Quality Mitigation Fund as a method of reducing NO_x emissions. PCAPCD's Off-site Air Quality Mitigation Fund supports fleet modernizations, repowers, retrofits, and fleet expansions of heavy duty on- and off-road mobile vehicles/equipment; alternative fuels infrastructure or low emission fuel purchases; new or expanded alternative transit service programs; light-duty low emissions vehicle programs; public education; repower of agricultural pump engines; and other beneficial air quality projects, which would help to reduce regional NO_x emissions.

- d. Some land uses are considered more sensitive to air pollution than others, due to the types of population groups or activities involved. Heightened sensitivity may be caused by health problems, proximity to the emissions source, and/or duration of exposure to air pollutants.

⁵ Fehr and Peer. *Final Transportation Impact Analysis for the Northwest Rocklin Area General Development Plan*, May 05, 2016.

Children, pregnant women, the elderly, and those with existing health problems are especially vulnerable to the effects of air pollution. Accordingly, land uses that are typically considered to be sensitive receptors include residences, schools, childcare centers, playgrounds, retirement homes, convalescent homes, hospitals, and medical clinics. The proposed project involves a change to the allowable daily trip cap for the Northwest Rocklin Area, but does not involve direct development or siting of new sensitive receptors. Nevertheless, major pollutant concentrations of concern, CO emissions and toxic air contaminant (TAC) emissions, are addressed in further detail below.

Localized CO Emissions

Localized concentrations of CO are related to the levels of traffic and congestion along streets and at intersections. The proposed project involves changes to the maximum daily trip cap for the project area. The City of Rocklin *General Plan Circulation Element* concluded that under currently approved land use designations and trip caps for the Northwest Rocklin Area, the project area's roadway system would operate above the General Plan required Level of Service (LOS) of C.⁶ Subsequent analysis conducted by Fehr and Peers and included in the *Transportation Impact Analysis* determined that the circulation system in the Northwest Rocklin Area included excess capacity that would not be used under the original daily traffic cap. Furthermore, the *Transportation Impact Analysis* concluded that the circulation system of the area would maintain acceptable LOS at all intersections with the addition of 20,967 daily trips to the project area.⁷

In accordance with the State CO Protocol, the PCAPCD recommends further analysis for localized CO concentrations if the project would cause a signalized intersection to be degraded from an acceptable LOS (i.e., LOS A, B, C, or D) to an unacceptable LOS (i.e., LOS E or F), or substantially worsen an already existing unacceptable peak-hour LOS at an intersection, as determined by a traffic study. As discussed, the project area's circulation system currently has sufficient capacity to accommodate the proposed increase in the daily traffic cap for the area.⁸ Therefore, the proposed project would not result in the degradation of LOS at any intersections from acceptable to unacceptable levels, and the proposed project would not result in the emission of substantial localized CO concentrations.

TAC Emissions

Another category of environmental concern is TACs. The CARB's *Air Quality and Land Use Handbook: A Community Health Perspective* (Handbook) provides recommended setback distances for sensitive land uses from major sources of TACs, including, but not limited to, freeways and high traffic roads, distribution centers, and rail yards. The CARB has identified diesel particulate matter (DPM) from diesel-fueled engines as a TAC; thus, high volume freeways, stationary diesel engines, and facilities attracting heavy and

⁶ City of Rocklin. *City of Rocklin General Plan* Adopted October 2012.

⁷ Fehr and Peer. *Final Transportation Impact Analysis for the Northwest Rocklin Area General Development Plan*. May 05, 2016.

⁸ *Ibid.*

constant diesel vehicle traffic are identified as having the highest associated health risks from DPM.

In recognition of potential health effects that TAC emissions could have on future sensitive receptors in the project area, the City of Rocklin *General Plan Air Quality Element* includes Policy OCR-58 and OCR-59, which require development projects to incorporate stationary and mobile source control measures during construction and operation as well as requiring consultation with the PCAPCD to develop stationary and mobile source control measures.⁹ The City of Rocklin *General Plan EIR* concluded that the aforementioned General Plan policies would reduce the exposure of sensitive receptors to substantial TAC concentrations. Additionally, the *General Plan EIR* included Mitigation Measure 4.2.1, which would reduce the exposure of sensitive receptors to potential health risks from TACs by maintaining adequate distance between existing and potential sources of TACs and existing or proposed sensitive receptors.

The proposed project involves the increase of the daily traffic cap for the Northwest Rocklin Area. As such, the proposed project would not directly involve development activities that could expose sensitive receptors to TACs. Additionally, development of the project area would be subject to the aforementioned City of Rocklin *General Plan Policies* and *General Plan EIR* mitigation measures.

Because the proposed project does not directly involve the siting of new sensitive receptors, nor the development of new stationary sources of TACs, the proposed project would not expose sensitive receptors to substantial concentrations of pollutants. Moreover, development of the region would be subject to all relevant *General Plan* policies and *General Plan EIR* mitigation measures. Therefore, impacts related to the exposure of sensitive receptors to substantial pollutant concentrations would be *less than significant*.

- e. Odors are generally regarded as an annoyance rather than a health hazard. Due to the subjective nature of odor impacts, the number of variables that can influence the potential for an odor impact, and the variety of odor sources, quantitative methodologies to determine the presence of a significant odor impact do not exist. Certain land uses such as wastewater treatment facilities, landfills, confined animal facilities, composting operations, food manufacturing plants, refineries, and chemical plants have the potential to generate considerable odors. Specific development projects are not included in the proposed project; rather, the proposed project involves increases in the daily traffic cap for the proposed project area.

Because the proposed project does not involve direct development activity, the proposed project would not result in the creation of odors from land development. Although less common, emissions of DPM from heavy-duty diesel truck traffic could result in objectionable odors. However, such odors would be created under currently approved build-out conditions. While the proposed project would increase the total amount of vehicle trips, the increase in area vehicle activity would not necessarily create an increase in heavy-duty diesel truck traffic, because much of the traffic increase would be a result of increased

⁹ City of Rocklin. *City of Rocklin General Plan*. Adopted October 2012.

residential land uses. Residential land uses are not typically associated with heavy-duty diesel truck traffic, and thus the increase in daily trips attributable to residential land uses would mainly involve single passenger vehicles that are not typically considered to be sources of objectionable odors.

Because the proposed project does not directly involve land development, and the increase in project area traffic would be largely through increased use of single passenger vehicles rather than heavy-duty diesel trucks, the proposed project would not be anticipated to create objectionable odors in the project area, from what was previously anticipated in the City of Rocklin *General Plan* and *General Plan EIR*. Therefore, the proposed project would result in a ***less-than-significant*** impact related to objectionable odors.

| VII. GREENHOUSE GAS EMISSIONS. <i>Would the project:</i> | Potentially Significant Impact | Less Than Significant with Mitigation Incorporated | Less-Than-Significant Impact | No Impact |

| b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gasses? | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

Discussion

- a,b. Emissions of GHGs contributing to global climate change are attributable in large part to human activities associated with the industrial/manufacturing, utility, transportation, residential, and agricultural sectors. Therefore, the cumulative global emissions of GHGs contributing to global climate change can be attributed to every nation, region, and city, and virtually every individual on Earth. A project's GHG emissions are at a micro-scale relative to global emissions, but could result in a cumulatively considerable incremental contribution to a significant cumulative macro-scale impact.

Implementation of the proposed project would cumulatively contribute to increases of GHG emissions. Estimated GHG emissions attributable to future development would be primarily associated with increases of carbon dioxide (CO₂) and, to a lesser extent, other GHG pollutants, such as methane (CH₄) and nitrous oxide (N₂O) associated with mobile sources or vehicles, utilities (electricity and natural gas), water usage, wastewater generation, and the generation of solid waste. Because the proposed project involves increased vehicle use in the area, the GHG emissions related to increased vehicle use in the area must be analyzed. The common unit of measurement for GHG is expressed in terms of annual metric tons of CO₂ equivalents (MT CO₂e/yr).

Previously, the City of Rocklin relied on methodology included in the California Air Resources Board's original *Climate Change Scoping Plan* for the analysis of potential impacts related to GHG emissions.¹⁰ The original Scoping Plan recommended an analysis methodology based on project-specific reductions in GHG emissions compared to a Business-As-Usual (BAU) scenario. The BAU scenarios were based off of GHG emissions projections for anticipated growth without the inclusion of measures that would reduce GHG emissions, such as improvements in vehicle fuel efficiency, energy efficiency, and the increased use of renewable energy sources for energy supply. However, on November 30, 2015, the California Supreme Court issued a decision in the *Center for Biological Diversity v. California Department of Fish and Wildlife* (Newhall Ranch) case, in which the court ruled that analysis based on BAU scenarios was insufficient to support conclusions that proposed projects would have less-than-significant impacts. In response to the Newhall Ranch Ruling, the City of Rocklin is relying on the proposed new guidance from the PCAPCD to determine the significance of proposed projects in regards to GHG

¹⁰ California Air Resources Board. *Climate Change Scoping Plan*. December 2008.

emissions. The City of Rocklin has determined that reliance on the proposed thresholds is justified as the BAU scenario is no longer considered adequate, and the City is within the PCAPCD's boundaries.

The proposed thresholds begin with a screening emission level of 1,100 MT CO_{2e}/yr. Any project below the 1,100 MT CO_{2e}/yr threshold is judged by the PCAPCD as having a less-than-significant impact on GHG emissions within the District and thus would not conflict with any state or regional GHG emissions reduction goals. Projects that would result in emissions above the 1,100 MT CO_{2e}/yr threshold would not necessarily result in substantial impacts, if certain efficiency thresholds are met. The efficiency thresholds, which are based on service populations and square footage, are presented in Table 3.

| Table 3 PCAPCD Operational Thresholds of Significance | | | |
|--|--------------|--|--------------|
| Efficiency Thresholds | | | |
| Residential (MT CO_{2e}/capita) | | Non-Residential (MT CO_{2e}/1,000 sf) | |
| Urban | Rural | Urban | Rural |
| 4.5 | 5.5 | 26.5 | 27.3 |

Source: Placer County Air Pollution Control District. CEQA Thresholds. Accessible at <http://www.placer.ca.gov/departments/air/landuseceqa/ceqathresholds>. Accessed October 2016.

Projects that fall below the 1,100 MT CO_{2e}/yr threshold or meet the efficiency thresholds are considered to be in keeping with statewide GHG emissions reduction targets, which would ensure that the proposed project would not inhibit the State's achievement of GHG emissions reductions. Thus, projects which involve emissions below the 1,100 MT CO_{2e}/yr threshold or below the efficiency thresholds presented in Table 3, are considered to result in less-than-significant impacts in regards GHG emissions within the District and would not conflict with any state or regional GHG emissions reduction goals. Finally, the PCAPCD has also established a Bright Line Cap, which shall be the maximum limit for any proposed project. The Bright Line Cap is 10,000 MT CO_{2e}/yr for all types of projects.

The proposed increase to the daily traffic cap for the area would result in increased amounts of vehicle use in the area, which would contribute to increases of GHG emissions that are associated with global climate change. The proposed project's mobile emissions were modeled using the same assumptions and methodology presented in the Air Quality Section of this report. A comparison of GHG emissions from the baseline modeling scenario and the proposed project scenario is presented below in Table 4.

| Table 4 UnMitigated Operational Mobile GHG Emissions (MT CO_{2e}/yr) | | |
|---|-----------------------------------|-------------------|
| Baseline Emissions | Proposed Project Emissions | Difference |
| 37,259 | 49,587 | +12,328 |

Source: CalEEMod, October 2016 (See Appendix)

The proposed project would include approximately 2,963,000 sf of non-residential structures. Therefore, given the proposed project's estimated mobile emissions, of 49,587

MT CO₂e/yr, the proposed project would result in an efficiency rate of 16.74 MT CO₂e/1,000 sf, which would be well below PCAPCD's urban non-residential efficiency threshold of 26.5 MT CO₂e/1,000 sf.

However, the difference of emissions between the baseline emissions, the emissions that would occur under the current trip cap for the project area, and the proposed project's emissions, the emissions that would result from increased vehicle use in the project area, would be 12,328 MT CO₂e/yr. The difference in emissions would therefore be above PCAPCD's Bright Line Cap of 10,000 MT CO₂e/yr. As a result, the proposed project would be considered to result in a ***potentially significant*** impact related to GHG emissions and global climate change.

Mitigation Measure(s)

The mitigation measure included in the Air Quality section of this report requires the development of an Air Quality Reduction Plan for any projects within the Northwest Rocklin Area that would increase mobile emissions beyond what was anticipated by the 2002 trip cap. Such Air Quality Reduction Plans would focus on the use of alternative modes of transportation, including non-motorized transportation, which would reduce the number of trips in the area and the vehicle trip lengths. Such reductions in the number and length of vehicle trips would result proportional reductions to GHG emissions in the project area. Therefore, application of mitigation measure III-1 would reduce the proposed project's potential impacts related to GHG emissions to a *less-than-significant* impact.

VII-1 Implement Mitigation Measure III-1

| | Parking Policy Pricing | Parking Policy Pricing Subtotal | 0.00 | | |
| No | Transit Improvements | Provide BRT System | 0.00 | | |
| No | Transit Improvements | Expand Transit Network | 0.00 | | |
| No | Transit Improvements | Increase Transit Frequency | 0.00 | | |
| | Transit Improvements | Transit Improvements Subtotal | 0.00 | | |
| | | Land Use and Site Enhancement Subtotal | 0.12 | | |
| No | Commute | Implement Trip Reduction Program | | | |
| No | Commute | Transit Subsidy | | | |
| No | Commute | Implement Employee Parking "Cash Out" | 4.50 | | |
| No | Commute | Workplace Parking Charge | | | |
| No | Commute | Encourage Telecommuting and Alternative Work Schedules | 0.00 | | |
| No | Commute | Market Commute Trip Reduction Option | 0.00 | | |
| No | Commute | Employee Vanpool/Shuttle | 0.00 | | 2.00 |
| No | Commute | Provide Ride Sharing Program | 10.00 | | |
| | Commute | Commute Subtotal | 0.00 | | |

| | | | | | |
|----|-------------|------------------------------|------|--|--|
| No | School Trip | Implement School Bus Program | 0.00 | | |
| | | Total VMT Reduction | 0.12 | | |

Area Mitigation

| Measure Implemented | Mitigation Measure | Input Value |
|---------------------|---|-------------|
| Yes | :Only Natural Gas Hearth | |
| No | :No Hearth | |
| Yes | :Use Low VOC Cleaning Supplies | |
| Yes | :Use Low VOC Paint (Residential Interior) | 100.00 |
| Yes | :Use Low VOC Paint (Residential Exterior) | 100.00 |
| Yes | :Use Low VOC Paint (Non-residential Interior) | 100.00 |
| Yes | :Use Low VOC Paint (Non-residential Exterior) | 100.00 |
| Yes | :Use Low VOC Paint (Parking) | 100.00 |
| No | :% Electric Lawnmower | 0.00 |
| No | :% Electric Leafblower | 0.00 |
| No | :% Electric Chainsaw | 0.00 |

Energy Mitigation Measures

| Measure Implemented | Mitigation Measure | Input Value 1 | Input Value 2 |
|---------------------|-----------------------------------|---------------|---------------|
| Yes | :Exceed Title 24 | 5.00 | |
| No | :Install High Efficiency Lighting | 0.00 | |
| No | :On-site Renewable | 0.00 | 0.00 |

| Appliance Type | Land Use Subtype | % Improvement |
|----------------|------------------|---------------|
| ClothWasher | | 30.00 |
| DishWasher | | 15.00 |
| Fan | | 50.00 |
| Refrigerator | | 15.00 |

Water Mitigation Measures

| Measure Implemented | Mitigation Measure | Input Value 1 | Input Value 2 |
|---------------------|--|---------------|---------------|
| No | Apply Water Conservation on Strategy | | |
| No | Use Reclaimed Water | | |
| No | Use Grey Water | | |
| No | Install low-flow bathroom faucet | 32.00 | |
| No | Install low-flow Kitchen faucet | 18.00 | |
| No | Install low-flow Toilet | 20.00 | |
| No | Install low-flow Shower | 20.00 | |
| No | Turf Reduction | | |
| No | Use Water Efficient Irrigation Systems | 6.10 | |
| No | Water Efficient Landscape | | |
